BitNinja Brings New Era to FastComet's Cybersecurity Operations

US-based FastComet has climbed from humble beginnings to become one of the top web hosting services in the world. Impressive reliability, outstanding 24/7 customer support and fantastic features are just some of their benefits. Over 50,000 personal and small business website owners trust FastComet to protect their sites from constantly emerging security threats.

Increasingly sophisticated attacks target WordPress vulnerabilities

Despite their already highly-secure systems, some FastComet customer sites using vulnerable code or outdated software were being compromised due to increasingly sophisticated threats. In particular, attacks exploiting outdated Wordpress scripts and plugins were common. FastComet also needed to scale up their hardware infrastructure, systems and software to accommodate their rapidly growing customer base.

BitNinja delivers on all FastComet's requirements

FastComet wanted a centralized defense system that would safeguard all servers proactively and provide the right tools to develop their infrastructure. FastComet also realized that protecting hosting nodes individually would help their scale-up plans, so they needed a solution that could provide this facility. FastComet tested several OpenSource and commercial scan services as well as application security extensions, but were disappointed with the results. Then FastComet discovered BitNinja's full spectrum solution that offers real-time protection against vulnerabilities, uses minimal server resources and effectively manages false-positive ratings.

The results

The implementation of BitNinja brought a new era to FastComet's organization. BitNinja goes beyond patching known CMS vulnerabilities by protecting the entire server from a wide range of attacks and threats. Elena Tileva, Marketing Manager at FastComet expressed her delight with BitNinja's complete security solution, commenting; "We're seeing great results in terms of malicious traffic prevention. BitNinja has prevented countless potential exploits, malicious objects and unwanted bots. Importantly, we saved an enormous amount of server resources that we can now use for legitimate customer activity."
